Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Three sets of clones were identified. Clone #12 encoded the 164 amino acid secreted form of VEGF A-subunit (see AAR22347). Clone #14 has a 135 bp deletion and thus encodes a 120 amino acid form and Clone #16 has a 72bp insertion and encodes a 188 amino acid form and Clone #16 has a 72bp insertion and encodes a 188 amino acid mature protein (AAR22351). The deleted region lies between the second base of the Am140 codon and the third base of the Am3184 codon. The 120 amino acid mature protein has Asn140 converted to Lys140. See also AAQ23038-023050
The full length coding region of the A subunit or monomer of VEGF is determined from three sets of overlaping CDNA clones. Degene: oligo. primers based on the amino acid sequences Phe-Met-Asp-Val-Tyr-Gln from polypeptide L42 (residues 42-47) and Cys-Lys-Asn-Thr-Asp from polypeptide T38 (residues 164-168) were under the first control of the fir
                                                                                                                                                                                                                                            Vascular endothelial cell growth factor sub-units - which stimulate vascular endothelial cell growth, used for inducing tissue repair
                                                                                                                                                                                                                                                                                                                                                                                                          Bayne ML,

                                                The present sequence represents a rat vascular endothelial growth factor II (VEGF II) A subunit variant with a conversion of Asn 140 to Lys 140, and the deletion of His 141 to Arg 184 from the wild-type given in AAW53639. The present invention describes: (1) a mammalian VEGF II protein comprising an A subunit from AAW53649, AAW53641, and a B subunit from AAW53639, AAW53640 or AAW53641, and a B subunit from AAW53639 or the first 115-135 amino acids of AAW53638; and (2) a mammalian VEGF comprising a heterodimer or homodimer of B subunits. The growth factor is used for promoting vascular development and repair and for promoting tissue repair.

N.B. The present sequence is not given inthe specification but is derived from Fig 5 as stated in the claim.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to PCR amplify the central region of the cDNA for VEGF A chain. A single band migrating at 420 bp was gel purified, digested with Sall, ligated into pcEm3Zf(+) and sequenced. The nucleotide sequence obtained (p4238) was used to design antisense and sense PCR primers to amplify the 5' and 3' ends of the cDNA. These 5' and 3' clones are denoted p5-15 and pw3, respectively. In addition to the cDNA coding the 164 amino acid secreted form identified by protein sequencing, two alternatively spliced cDNAs encoding a 146 amino acid forms are cloned and sequenced. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; Page -; 46pp; English

                                                                                    Query Match
                                                                                                                                       This is the amino acid sequence of a 146 amino acid residue A subunit of vascular endothelial cell growth factor (VEGF). The invention relates to a purified and isolated VEGF c subunit amino acid sequence AAY57025, VEGF exists in various microheterogenous forms, and is useful for the promotion of vascular development and repair. The invention also relates to human VEGF heterodimers AC or EC and homodimer CC, where A, B and C are subunit amino acid sequences. The VEGF AC, BC or CC amino acid sequences can be used in a tissue repairing pharmaceutical composition. The novel growth factors are useful for the production or coverage of artificial blood vessels with vascular endothelial cell. They are also useful for the induction of tissue growth and repair.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention is concerned with the human vascular endothelial growth factor (VEGF) C subunit. VEGF is a vascular endothelial cell mitogen and can be used to promote vascular development and repair. The C subunit may exist as a homodimer or a heterodimer with the VEGF A or B subunit. VEGF can be used in the treatment of wounds of mammals, to cover artificial blood vessels with vascular endothelial cells, in the

The human colon cancer antigens can have cytostatic, cardioactive, muscular; neuroprotective, immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antiinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polynucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, immune system disorders, muscular disorders, reproductive disorders, immune system disorders, muscular disorders, AAC98772 and cardiovascular disorders. The product can be used for angiogenesis and re-endothelialisation of inner vascular surfaces in wound healing, e.g. treatment of full-thickness wounds such as dermal ulcers, venous ulcers and diabetic ulcers, burns, in surgery, in balloon angioplasty and for the in vitro culturing of endothelial cells. Hybrid growth factors of pDGF and VEGF can exhibit a mitogenic profile between each factor and can be used for wound healing or as inhibitors of angiogenesis for e.g. preventing the growth of tumours.
                                                                                                                                                                                                                                                                                                                        /note= "inserted amino acid relative Misc-difference 115 \,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match
                                    The present sequence represents vascular endothelial growth factor (VEGF) 121. The specification describes a monoclonal antibody which is specific to VEGF 121, and a hybridoma producing this antibody. The antibody is used in a method for measuring the amount of VEGF 121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence of AAQ44260 contains an open reading frame correspond to the 165 amino acid human vascular endothelial cell growth factor (hVEGF-165, see AARA38921). Alternative splicing of the sequence gives a shorter coding sequence which encodes the 121 amino acid hVEGF (see AARA2607). The full length coding sequences

Such dimers are are useful in pharmaceutical compositions and the method provides yields of 31-39.7%, in examples, compared with about 10% for the conventional method (see Biochemistry, 28 (1989) 2956). ANY08278-Y08301 are human growth factor protein fragments used in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence encodes a monomer of a vascular endothelial growth CC factor (VEGF) dimer. The dimer comprises a first and a second monomer, CC each comprising at least amino acids 11-116 of a defined 147 amino acid CC sequence, or a sequence having at least 90% identity to the defined CC sequence, and retaining a cysteine at or corresponding to position 116, CC which is disulphide-bonded to an additional extraneous cysteine. The CC vEGF dimer is useful for inducing angiogenesis and vascular remodelling, CC treating peripheral arterial disease, coronary artery disease, essential compertension, microvascular angiopathy and polycystic kidney disease, coronary disease, diseases, diseases arising from disordered transport of solutes coronary diseases, and disorders due to accumulation of ascites in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a fusion protein comprising non-heparin binding vascular endothelial growth factor (VEGF) peptide portion and a non-VEGF peptide portion and useful for promoting angiogenesis and/or bone growth in mammalian host. The fusion protein is useful for promoting angiogenesis, wound healing and bone growth. Compositions containing bone growth promoting fusion protein can be used to treat osteoporosis, rheumatoid or osteoarthritis, to improve poor bone healing, to promote implant integration and function of artificial joints and to facilitate bone reconstruction. They can also be used to treat e.g. ulcers, lesions, injuries, burns, trauma, periodontal conditions, lacerations and other conditions. The invention is also useful in protein therapy. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel polypeptide that is a parapox virus homolog of human vascular endothelial growth factor (PPV-VEGF) and stimulates endothelial cell proliferation. The products of the invention have angiogenic activity. The polypeptide can be used in pharmaceutical compositions for therapeutic or diagnostic use, e.g. for stimulating angiogenesis or tissue repair or for immunomodulation, e.g. by stimulating endothelial cell proliferation or inhibiting dendritic cell stimulating endothelial cell proliferation or inhibiting dendritic cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    differentiation. Nucleic acids encoding the polypeptide can be used in pharmaceutical compositions for DNA vaccination or gene therapy. This sequence represents a protein fragment of a parapox virus D1701 vascular endothelial growth factor (VEGF) homologue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Homolog of human vascular endothelial growth factor useful for stimulating endothelial cell proliferation, e.g. for stimulating angiogenesis or tissue repair or for immunomodulation

CARR91075-R91078 are human vascular endothelial growth factors (VEGFs).

Charles a heroding a VEGF can be used to create a fusion protein (FP),

Che cDNA encoding a VEGF can be used to create a fusion protein (FP),

Che cDNA of which includes a nucleic acid binding domain (NABD) and

Che encodes a heparin binding growth factor, HepGF (e.g. VEGF, FGF, HEEGF),

Che a protein synthesis inhibitor and opt. a linker imparting flexibility

Che the FP. The FP can be used to target a protein synthesis inhibitor,

Che an antisense DNA sequence or an inhibitor of elongation factor 2, to a

Che cell carrying a HepGF receptor. The conjugates of the invention are

Che used to inhibit cell proliferation in cells carrying the particular

Che creating a receptor. A specific application is to prevent

Che carriers in the anterior eye after surgery, partic. to prevent

Che carriers in the anterior eye after surgery, partic. to prevent

Che carriers laser treatment. Other conditions which may be treated include

Che cut a ser treatment. Other conditions which may be treated include

Che complications, Kaposi's sarcoma and rheumatoid arthritis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      protein search, using sw model

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DB seq length: 0
